

Clinical Services EMR Review

**How clinic data can guide better operations and
leadership decisions**

Understanding Program Performance Through Data

Leadership Goals

Understand how clinical services programs are performing across the organization

Data-Driven Decisions

Use EMR data to improve operations, support community needs, and strengthen budget decisions

Pattern Analysis

Reviewed EMR data to identify patterns in service flow and patient experience

What Data Was Used

Dataset Overview

- De-identified EMR dataset with 1,000 visits
- 23 fields covering patient demographics, visit details, and outcomes
- Records cleaned and validated for analysis

Data Preparation

- Cleaned timing data to ensure accuracy
- Removed records with missing wait-time information
- Created derived measures including wait time, visit duration, and month

Overall Performance Snapshot

After data cleaning and validation, **786 visits** were included in the main analysis.

18.46

Average Wait Time

Minutes from arrival to provider

27.90

Average Visit Duration

Minutes of total visit time

4.03

Average Satisfaction

Out of 5.0 possible points

Where Performance Differs by Program

Wait times varied significantly across clinical services programs, revealing opportunities for improvement.

This variation shows that some programs are moving patients through faster than others, suggesting differences in operational efficiency or service complexity.

When Demand Is Highest

Visit volume changed across the year, with **September** having the highest volume. High-demand months may need more staffing or better scheduling support. Demand patterns matter when planning operations.

What Affects Patient Satisfaction

Key Finding

The relationship between wait time and satisfaction showed a **negative correlation of -0.61**.

This means longer waits were generally linked to lower patient satisfaction scores.

What This Means

Wait time appears to be an important driver of patient experience. Reducing wait times could directly improve how patients perceive their care.

What Leadership Should Do

Reduce Wait Times

Focus on reducing wait times in high-volume programs where patient volume is greatest

Track Key Metrics

Use wait time and satisfaction together as KPIs over time to monitor progress

Optimize Staffing

Review staffing and scheduling to improve patient flow and reduce bottlenecks

Implementation Roadmap

01

Baseline Assessment

Document current wait times and satisfaction scores by program

02

Staff Review

Analyze staffing levels during high-demand periods and identify gaps

03

Process Changes

Implement scheduling improvements and workflow optimizations

04

Monitor Results

Track metrics monthly and adjust approach based on data

✅ **Expected Impact:** These changes could help both service quality and patient experience, leading to improved satisfaction scores and more efficient operations.

Clear Opportunities to Improve Operations

Act on Wait Times

Shorter waits may help improve satisfaction and overall performance

Monitor Key Metrics

Track wait time and satisfaction together over time

Optimize Resources

Review staffing and scheduling to improve patient flow

Thank you. Data-driven insights can guide better operations and leadership decisions.
